

Development Activity 1 — Build and Host Your Project Prototype

Activity Objective

You have already selected your semester project. In this activity, you will take the **first practical development step toward your final system**.

You will develop a **working frontend prototype of your selected project and host it online** so that it can be accessed through a public URL.

Important: This is not a separate practice task. The work you complete today will become the **first version of your final semester project** and will be extended throughout the semester.

Task 1 — Develop the Initial Prototype

Develop the **initial frontend version** of your selected system.

Your prototype must contain at least **3 connected pages**:

Page 1 — Home / Landing Page

Include:

- Project/system name
- Purpose of the system
- Short description
- Navigation
- Appropriate buttons/links
- Footer

Page 2 — Login / User Entry Page

Include the fields relevant to your system, such as:

- Username/email
- Password
- Other required information, where appropriate

The page should have a clear and usable interface.

Page 3 — Core Functional Page

Create **one important functional page from your actual project**.

Examples:

Project	Possible Page
Provincial Complaint Management System	Submit Complaint
Student Community Management System	Community Posts
Alumni Collaboration System	Alumni Directory
Blood Donor System	Blood Request
Internship Management System	Internship Opportunities
Food Donation System	Donation Request

The page should reflect the **actual purpose of your selected system**.

Task 2 — Add Basic Functionality

Your prototype should not be completely static.

Implement at least **three simple interactions** using JavaScript.

Examples:

- Form validation
- Search
- Filtering
- Show/hide password
- Dynamic list
- Confirmation message
- Modal
- Character counter
- Add/remove item
- Navigation interaction

The interaction should make sense for your selected system.

Task 3 — Make the Pages Connected

Users should be able to move between the pages.

For example:

Home → Login → Dashboard/Core Module

Do not submit three unrelated HTML pages.

Task 4 — Design With Your Intended Users in Mind

Use the **roles identified in your project proposal**.

For today's activity, choose **one primary user role** and design the interface around that user's needs.

For example:

Provincial Complaint System → Citizen

Alumni System → Alumni Member

Internship System → Student

Think about:

What does this user need to see? What does this user need to do?

Do not place every possible function on one screen.

Task 5 — Apply Basic Security-Aware Design

Even though you are currently developing only the frontend, your design should already reflect security awareness.

Consider:

- Do not display unnecessary sensitive information.
- Do not expose administrative functions to ordinary users unnecessarily.
- Use password fields appropriately.
- Collect only information that is actually required.
- Do not design interfaces that unnecessarily reveal private information.
- Clearly distinguish between different user roles where relevant.

Note: Hiding a button is not a real security control. Actual enforcement will be implemented when the backend is developed later in the semester.

Task 6 — Host Your Project Online

Your project must be **accessible online through a public URL**.

You may use any suitable hosting platform available to you, such as:

- GitHub Pages
- Netlify
- Vercel
- Another suitable web-hosting service

Required

Your submitted project must have:

Public URL:

The instructor should be able to open the URL and view your prototype.

Do not submit only screenshots or local files. The actual prototype must be hosted online.

Task 7 — Test Your Public Website

After hosting your project:

1. Open the URL in your browser.
2. Test every page.
3. Test all navigation links.
4. Test your JavaScript interactions.
5. Check the website on a different browser or device where possible.
6. Make sure there are no broken links or missing files.

Then ask another person in your group to use the website without explaining how it works.

Record One Problem

Problem discovered:

How you fixed it:

Task 8 — Prepare for the Next Class

In the next class:

- **Everyone must bring their laptop.**
- Groups will be selected **randomly** for demonstration.
- You may be asked to open your **live website** and demonstrate it.
- You should be able to explain what you developed and how it relates to your selected project.

You should therefore make sure that your website is working **before coming to the next class**.

Submission

Submit the following:

1. Project Information

Project Name: _____

Group Members: _____

Primary User Role: _____

2. Live Website

Public URL:

3. Developed Pages

1. _____
2. _____
3. _____

4. JavaScript Interactions

1. _____
2. _____
3. _____

5. Testing

Problem discovered:
